Professional Summary

Motivated Data Science Engineer with a strong foundation in Python, SQL, and core data science libraries such as NumPy, pandas, scikit-learn, and Matplotlib. Skilled at collecting, cleaning, and analyzing structured data to build simple predictive models and insightful visualizations. Hands-on experience includes small projects for data preprocessing, exploratory data analysis, and training basic machine learning models, ensuring data pipelines are clean and analysis-ready. Eager to apply and grow these skills in real-world projects, collaborate with cross-functional teams, and continuously learn modern data tools and best practices.

Courses

- Completed C and C++ coursework through Cisco Networking Academy, building a strong base in programming logic and problem-solving.
- Learned Python for writing clean, readable code and implementing core algorithms and scripts for automation.
- Studied SQL and DBMS concepts, including relational database design, querying, and data manipulation using structured queries.
- Completed Data Structures and Algorithms (DSA) using C, implementing arrays, linked lists, stacks, queues, trees, and sorting/searching algorithms in C.
- Gained exposure to NoSQL databases, understanding flexible schema design and when to use non-relational data models.
- Covered Design and Analysis of Algorithms (DAA), focusing on time and space complexity, divide-and-conquer, greedy, and dynamic programming strategies.
- Actively applying these skills in coding practice and academic projects, aiming for roles in software development, backend engineering, and data-oriented profiles.

Education

NIST University

Btech in Computer Science

Aug 2024 – Aug 2028

- GPA: 9.48/10
- **Coursework:** Computer Science and engineering, computational theory.

Internship

Datascience Intern

CODTECH — Remote —

Sept 2025 – Oct 2025

- Task 1 – Data Pipeline Development: Built an automated ETL pipeline using Pandas and Scikit-learn for data preprocessing, transformation, and loading.
- Task 2 – Deep Learning Project: Developed and trained a deep learning model for image classification/NLP using TensorFlow/PyTorch, with result visualizations.
- Task 3 – End-to-End Data Science Project: Delivered a full-stack data science solution from data collection to model deployment via Flask/FastAPI.
- Task 4 – Optimization Model: Solved a business problem using linear programming techniques with PuLP, presenting insights through a structured notebook.

Academic Projects

Time Zone Conversion

- Built a procedural program in C to convert local time across countries using UTC offsets.

- Applied functions, conditional logic, and string handling for modular design and accurate 24-hour conversions.
- Designed with scalability for additional countries and DST support.
- Tools Used: C-libraries,VSCode.

Browser History Simulation

- To simulate browser navigation using fundamental data structures in C.
- To implement stack and queue operations in a real-world application.
- To enhance understanding of LIFO (Last-In-First-Out) and FIFO (First-In-First-Out) behaviours.
- Tech-stack Used: c,stack,queue,circular queue.

Cafe Billing System

2025

- Automation of Operations Streamlines order recording, bill generation, and payment tracking to reduce manual effort and improve efficiency.
- Database Reliability Uses relational tables and stored procedures to ensure data integrity, minimize redundancy, and enable quick information retrieval.
- Practical DBMS Application Demonstrates how database concepts can create a structured, scalable, and user-friendly solution for restaurant order and billing management.
- Concept Used: Sql,Aggretron,Normalisation,constraints,joins.

Technologies

Languages: Python,c++, C, SQL

Technologies: VSCode,Github,NumPy,Pandas,Matplotlib,Scikit-learn
